# DELIVERPOINT

USERS UPLOAD DOCUMENTS to SharePoint® every day without truly understanding who is able to see their content. Do you assume that 'Limited Access' means that the users from other business units are unable to see your content? SharePoint® out-of-the-box permission reports are not an accurate representation of who can see, manipulate or delete your content. SharePoint® farm administrators put permissions into place without the true business knowledge of who should see your content.

DeliverPoint provides accurate reports that are within the context of SharePoint® allowing users to upload their content with the confidence that it won't fall into the wrong hands.

Reduce financial risk by ensuring that your content is safe.

COPY PERMISSIONS IN BULK

DELETE PERMISSIONS IN BULK

DEAD ACCOUNTS

TRANSFER PERMISSIONS

CLONE PERMISSIONS

PERMISSION INHERITANCE REPORTING

PERMISSIONS MANAGEMENT FOR THE BUSINESS USER

LAMNALCO

"Lightning Tools' DeliverPoint gave me the required functionality allowing my Site Owners and Site Collection owners to have more control of permission management and permission reporting."

- Accurate permission reporting
- In context permission reporting
- Copy, transfer and delete permissions
- Clone permissions
- Delete permissions
- Remove dead accounts
- Permission inheritance reporting.

DeliverPoint – empower your users to manage permissions

SharePoint® Site Owners and Site Collection Owners usually understand who needs permissions to their SharePoint® content better than the SharePoint® Farm Administrator. DeliverPoint empowers Site Owners & Site Collection Administrators to accurately report on permissions and manage them in bulk!

Permission Reporting & Management

DeliverPoint displays users permissions accurately even when permissions are granted through Active Directory groups. Copy, Transfer, Delete, Grant permissions are just some of the features for bulk permissions management.

Discover Permissions and Broken Permission Inheritance within a List or Library

If you have thousands of documents in a document library, and unsure where permission inheritance has been broken, DeliverPoint will produce a list of all documents with broken permission inheritance allowing you to discover and manage the permissions on those documents.
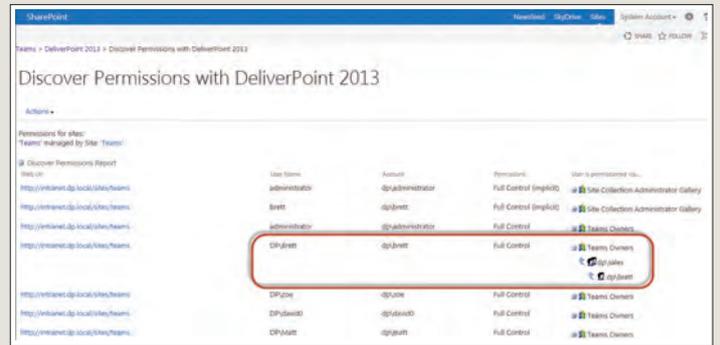

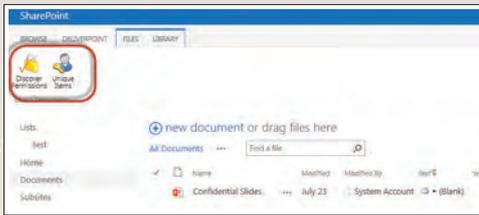

Show exactly how permissions have been granted

The Discover Permissions report which can be run against a site, multiple sites, lists, libraries, folders items and documents displays all users with permissions to that object and exactly how the permissions were granted.

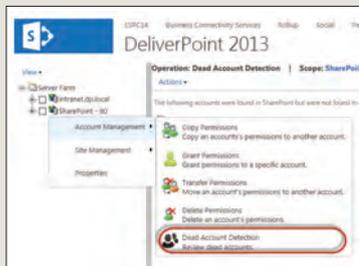

Unique Permissions Report

The Unique Permissions report displays a specific accounts (User or Domain Group) granted permissions. All group memberships, Site Collection Administration Designations, Site Permissions, List Permissions, Folder and Item Permissions are included within the report which can be scoped to a Farm, Web Application, Site Collection, or Site. The report can also be exported (Snapshot).

Dead Account Detection

DeliverPoint produces a report of all users who have permissions within SharePoint®, despite the Active Director Account being disabled or deleted. DeliverPoint provides an option to remove all dead accounts or specific dead accounts which provides users with a cleaner permission set.

Manage Permission Inheritance on Sites and Lists

Do you come across sites and lists that have broken permission inheritance instead of inherited permissions? It's time consuming to re-inherit on site or list at a time. Using DeliverPoint, you can manage inheritance in bulk on multiple selected sites and lists.
